

Pneumatic Rotary Control Valve Type 3310/3278 and Type 3310/AT

Rotary Control Valve Type 3310

Application

Rotary control valve for industrial applications, especially for processes requiring high valve capacity with minimum pressure drop and/or tight shutoff with fibrous media.

Nominal sizes 1" to 10" (25 to 250 mm)

Pressure ratings ANSI Class 150 and 300

Temperatures -20 °F to +430 °F (-29 °C to +220 °C)

These valves comply with ANSI, ASME and ASTM standards

The control valves consist of a body with "v-notch" characterized ball segment and a pneumatic spring-and-diaphragm actuator (single-acting) Type 3278 or a rack-and-pinion actuator (single-acting Type SRP or double-acting Type DAP).

Features

- Highest flow coefficients (Cv values) per nominal size
- Dual characteristic v-notch (equal percent and linear)
- Soft seat or optional metal seat
- Short face-to-face dimension, per ISA-S75.04
- Installation raised-face flanged according to ANSI B16.5
- Reversible flow direction, e.g. for highly erosive applications
- Live-loaded, self-adjusting PTFE V-ring stuffing box
- Actuator mounting to valve according to ISO 5211 or DIN 3337
- Control accessory mounting for actuator Type AT-SRP/DAP according to VDI/VDE 3845
- Direct mounting of SAMSON control accessories to actuator Type 3278

Standard version

- Body material ASTM A 216 WCB or A 351 CF8M
- Nominal valve sizes 1" to 10" (25 to 250 mm)
- Temperatures from -20 to +430 °F (-29 to +220 °C)
- Soft seat of PTFE with metal backing ring

Options

- **Metal seat** for shearing action with fibers or large particulates
- **Valve shaft** with keyed or square splined end
- **Hand-operated override** for pneumatic actuators
- **Hand-operated actuator**, where automation not required
- **Special versions** (e.g. end connections, packings) on request

Actuator combinations

Type 3310/3278 (Fig.1) · With single-acting pneumatic spring-and-diaphragm actuator Type 3278 (see Technical Data Sheet T 8321).

Type 3310/AT-SRP (Fig.2) · With single-acting, spring-return pneumatic rack-and-pinion actuator, Type SRP

Type 3310/AT-DAP · With double-acting, pneumatic rack-and-pinion actuator, Type DAP (requires double-acting control positioner)

Principle of operation (Fig. 3)

The medium flows into the ball segment valve against the convex side of the ball. When the valve is closed, the pressure acts on the convex side of the ball. The flow coefficient (C_v) value is determined by the opening angle of the ball.

Depending on the direction the ball is opened, the inherent characteristic of the ball can be selected as either equal percentage or linear. This is accomplished by the mounting position, turning direction and setting of the mechanical travel stops of the actuator.

The seal ring (2.1) and seat retainer (2) are held in place by the force of the pipeline flanges. The ball segment (3) is guided by the rotating counter shaft (5), which is sealed by the bottom flange (4) and gasket (17). The counter shaft has a square splined end, which is locked to the ball segment by the position of a ball bearing as dictated by a threaded pin, located within the counter shaft. The ball segment is secured to the actuated shaft by a spring clip (3.1).

The packing (15) is retained by a flange (8), secured by two bolts (9), which requires no adjustment in the field. The packing V-rings increase the shaft sealing force with increasing fluid pressure. The packing spring (11) provides the optimum loading force for the packing throughout the entire pressure range of the valve.

Fail-safe action

With the actuator Type 3278 and Type AT-SRP, the control valve has two fail-safe positions, that when pressurizing the piston or diaphragm as well as with loss of air supply are possible:

"Valve Fail Closed", with loss of supply pressure, the actuator springs force the valve to close

"Valve Fail Open", with loss of supply pressure, the actuator springs force the valve to open.

The actuator Type AT-DAP is configured without springs. A defined end position is not attained with loss of supply pressure. Control accessories, such as a volume tank, can be specified, in the case where a fail-safe position is still required by the application.

Installation

The valve is provided with two screws (2.3), which retain the seat retainer (2) during shipment. These screws are to be removed before installation into the pipeline. Appropriate torques are required for the valve flange bolting in order to assure sealing with the flange gasket and tight shutoff of the seat with the ball segment. Note: Flange bolting and gaskets are not provided with the valve, and are to be ordered separately.

In order to reduce erosion of the body with abrasive media, the flow direction can be reversed. The angle of rotation is decreased from 90° to 70° in such cases, by the adjustment of the mechanical travel stop setting of the actuator.

Table 1 · Technical Data

Nominal valve size	1" to 10" (25 to 250 mm)
Pressure rating	Class 150/300, according to ASME/ANSI B16.34
Temperature range	-20 to +430 °F (-29 to +220 °C)
Maximum differential pressure	According to ASME/ANSI B16.34, except: with Temperatures >300 °F (150 °C) and PTFE-seal: $\Delta p_{max} = 145$ psi (10 bar)
End connections	Raised-face flanges, according to ASME/ANSI B16.5
Installation length (face-to-face)	According to ISA-S75.04 (short version)
Flow direction (normal)	Against the convex side of the ball segment
Nominal opening angle	90° (with reversed flow direction for control: 70°)
Inherent flow characteristic	Equal percentage or linear
Rangeability	> 100 : 1, according to ANSI/ISA-S75.11
Terms for control valve sizing, according to ISA-S75.02	C_v , K_{vs} , F_L , X_T - see Tables 3 and 4
Stuffing box design	V-ring, spring-loaded, self-adjusting
Sealing versions	Soft-seat: PTFE, reinforced Metal-seat: Stainless steel, hardened
Leakage rate class, according to ANSI/FCI 70-2 and IEC 534 Part 4	
Soft-seated	Class VI
Metal-seated	Class IV

Table 2 · Materials

Body	ASTM A 216 WCB	ASTM A 351 CF8M
Ball segment	AISI 316 L, hardened	
Clip ring	AISI 316 L	
Seat	Soft-sealed version: PTFE with stainless steel backing ring Metal-sealed version: Stainless steel	
Seat retainer	Stainless steel	
Shaft	AISI 316 Ti	
Bearing (sleeve-type)	AISI 304 / PTFE-coated	
Stuffing box packing	1" to 6" :V-Ring-Packing PTFE with Carbon compound · Spring: AISI 301 8" to 10" :Braided cord rings, PTFE-Univerdit/Alchem compound · Spring: AISI 301	
Bottom flange	Forged carbon steel ASTM A 105	AISI 316 L

6"	1400	0.98"	49.6	320	25 ... 50	74	87	81	174	145

¹⁾ With reverse flow direction, the opening angle is reduced to 70°.

²⁾ Valid only for standard flow direction.

Notes:

- Depending on the valve conditions (cavitation, vaporisation, gas formation), the differential pressure should be limited.
- Maximum exit velocity for liquids is 13 ft/s. If cavitation exists, the maximum exit velocity should not exceed 6.5 ft/s.
- Maximum exit velocity for gases is Mach 0.3.

Ordering information

Rotary Control Valve Type 3310:

Nominal valve size ¹⁾ ...
Body material ASTM ...
Pressure rating ANSI Class ...
Seat ... Flow direction ...
Cv/Kvs value ¹⁾ ...
Characteristic ...
Options/Special version ...
Special testing/preparation ...

Actuator:

Type ... Ordering information ⁵⁾ ...
Fail-safe position ...

Operating conditions ²⁾:

Process fluid ³⁾ ... Flow rate ⁴⁾ ...
Inlet pressure ... Outlet pressure ⁴⁾ ...
Temperature ...
Maximum shutoff Δp for actuator sizing ...
Air/power supply available for actuator, max./min. ...

Accessories:

Positioner, Switches, Transmitter, Solenoid valve,
Filter/regulator,
Bypass, Volume/pressure amplifier, Lockup relay ...
Type ... Ordering information ⁵⁾ ...
Tubing and fittings type/material ...

Other instrumentation:

Controllers, Sensors, Transmitters, Transducers, Converters ...
Type ... Ordering information ⁵⁾ ...

Notes:

- ¹⁾ If nominal size or Cv/Kvs value unknown, specify operating conditions
- ²⁾ Specify system of units, pressures: specify gauge or absolute. Provide minimum, normal, and maximum values, where applicable. Gases, vapors: specify flow rate under standard or actual conditions
- ³⁾ Non-standard process fluids, specify additionally:
Density, Specific gravity, or Molecular weight ...
Liquids: Vapor pressure, Critical pressure, Viscosity ...
Gases, Vapors: Ratio of specific heats, Compressibility factor
- ⁴⁾ Or, specify required valve flow coefficient Cv ,Kvs ...
- ⁵⁾ Ordering information per the applicable Technical Data Sheet.
